

Dopamine Protocol: Decentralized Accountability Infrastructure

Core Manifesto & Architecture Litepaper v1 *Anchored in*

IPFS: bafybeib4rteqxzeoh62xhbg16v6v6y6xpjyrtm6a5tkbwhb7w6aynxwx4

1. Executive Summary

Dopamine Protocol is a Web3 infrastructure designed to solve the execution gap in personal and professional commitments. By merging smart contract financial staking, AI-driven verification, and non-transferable Soulbound Tokens (MOTIV), we convert loose intentions into cryptographically verifiable **Proof-of-Action**.

2. Core Problem & Solution

- **The Problem:** Modern goal-setting tools lack real friction and accountability. Intention without collateral leads to cheap commitments and high failure rates.
- **The Solution:** A decentralized protocol enforcing **Skin in the Game**. Users back their commitments with economic stakes, verified by AI models upon objective task execution.

3. Key Protocol Mechanics

- **Commitment Staking:** Users lock a financial stake in a smart contract tied to a defined, verifiable milestone and deadline.
- **AI Verification Oracle:** Machine learning models evaluate submitted proof of execution (data streams, API integrations, media proof) to validate completion.
- **MOTIV Reputation Minting:** Successful verification returns the stake and mints a non-transferable **MOTIV** Soulbound Token, creating an immutable on-chain reputation.
- **Slashing Mechanism:** Failure to provide valid verification within the window results in automated forfeiture of the stake.

4. Founder & Vision

Engineered by a leadership team with 10 years of experience managing high-stakes physical assets and complex logistics across North America, applying real-world risk management and absolute accountability to Web3 primitives.
